

PROGRAMMING PROJECTS

- ■ **P11.1** Write a program that reads in `worked_example_1/babynames.txt` and produces two files, `boynames.txt` and `girlnames.txt`, separating the data for the boys and girls.
 - ■ ■ **P11.2** Write a program that reads a file in the same format as `worked_example_1/babynames.txt` and prints all names that are both boy and girl names (such as Alexis or Morgan).
 - ■ **P11.3** Using the mechanism described in Special Topic 11.1, write a program that reads all data from a web page and writes them to a file. Prompt the user for the web page URL and the file.
- 4) **Programming:** Write a program that reads a file in the same format as `worked_example_1/babynames.txt` and prints all names with its population in its population rank (list names that are both boy and girl names separately).
